

HCAHPS Composite 2: Communication with Doctors
NQF#: 0166
Developer: Agency for Healthcare Research and Quality (AHRQ)
Data Source: CMS
Description: The HCAHPS survey is a measure of patient experience in the hospital. The target population for HCAHPS measures include eligible adult inpatients of all payer types who completed a survey. The Communication with Doctors measure summarizes how well patients feel their doctors explained things clearly, listened carefully to the patient, and treated the patient with courtesy and respect. Effective communication between doctors and patients can be reassuring to the patients and can help prevent errors like medication mix-ups or misdiagnoses.
Rationale: The HCAHPS survey has led to insights such as hospitals that provide better patient experience of care have higher adherence rates to clinical guidelines, lower risk-adjusted mortality rates, and lower readmission rates. When used correctly, HCAHPS linear mean scores provide valid and reliable measures of hospital quality that can compel hospitals to assess and improve patient experience. For example, hospitals with better doctor communication ratings have been shown to also have lower rates of hospital acquired conditions (HACs) and patient safety indicators (PSIs).
